

Restatement And Paragraph Fitting

A. Mastering Sentence Restatement

In restatement questions, you will be given a complex sentence highlighted from the passage. The options will contain five different ways to rewrite that sentence. Your mission is to find the option that preserves the core logical meaning without adding new assumptions or dropping vital facts.

- The Translation Strategy:
 1. Break Down the Core Logic: Identify the conditions. Is it a cause-and-effect? A contrast? A condition?
 2. Eliminate Over-Extremes: Throw away options that insert extreme words like *always*, *never*, *completely*, or *only* if those words were not in the original sentence.
 3. Watch Out for "False Friends": Do not pick an option just because it uses the exact same vocabulary as the text. Clever distractors copy the words but shuffle them around to change the meaning.

B. Conquering Paragraph Fitting (Missing Sentences)

Paragraph fitting questions present you with a text that has a blank space, usually marked with a symbol like [...]. You must choose the sentence that best fits the blank to maintain the paragraph's cohesion (structural flow) and coherence (logical connection).

- The Bridging Tactic:
 - Do not just look at the blank space. Read the sentence immediately before it and the sentence immediately after it.
 - The correct answer must act as a physical bridge. If the sentence before talks about a *problem* and the sentence after talks about a *result*, the missing sentence must explain the *cause* or the *action* that connects them.

C. Worked-Out Example & Detailed Review

Read the following passage carefully:

A sedentary lifestyle, characterized by prolonged periods of sitting and a lack of physical activity, is deeply entrenched in modern office cultures. Many employees spend upwards of eight hours a day anchored to their desks, staring at screens. [...] This lack of movement slows down the body's metabolic rate, which drastically impairs its ability to regulate blood sugar levels and break down fats efficiently.

Highlighted Sentence: *The long-term consequences of this physical inactivity are so profound that health experts now equate the medical risks of chronic sitting directly to those associated with smoking.*

Question 1 (Paragraph Fitting): Which of the following sentences best fits the blank space [...] in the paragraph?

- A. Regular physical exercise has been shown to boost workplace productivity and boost employee morale.
- B. This continuous physical immobility is not merely a matter of poor posture; it alters our internal physiology.
- C. Most modern corporations are now heavily investing in ergonomic standing desks to improve spinal alignment.
- D. Smoking remains the leading cause of preventable respiratory illnesses worldwide.
- E. Nutritional tracking apps help office workers monitor their daily caloric intake.

- Answer Explanation: Let's look at the context surrounding the blank space [...]:
 - *Sentence before:* Discusses employees sitting for eight hours anchored to desks.
 - *Sentence after:* States "This lack of movement slows down the body's metabolic rate... alters physiology". The missing sentence must bridge the physical act of sitting to the internal bodily changes. Option B does this perfectly by stating that this continuous physical immobility goes beyond surface posture and alters internal physiology, leading smoothly into the next sentence's explanation of metabolism. Option A, C, and E introduce outside topics (productivity, desk investments, nutrition apps) that break the logical chain. Correct Answer: B

Question 2 (Restatement): Which of the following options best restates the meaning of the Highlighted Sentence?

- A. Health experts believe that individuals who smoke are much more likely to develop a sedentary lifestyle at the office.
- B. Sitting for long periods poses severe medical hazards that are comparable to the dangers of chronic smoking.
- C. The health risks of physical inactivity can be completely avoided if an office worker decides to quit smoking.
- D. Chronic sitting causes respiratory damage that is identical to the internal cellular destruction found in heavy smokers.
- E. Experts argue that smoking is slightly more dangerous than sitting, though both are chronic conditions.

- Answer Explanation: Let's dissect the original sentence: *Long-term physical inactivity is so profound that risks of sitting are equated directly to smoking.* (Sitting risks = Smoking risks).
 - Option A changes the direction (says smokers become lazy).
 - Option C introduces a false solution (quitting smoking cures sitting damage).
 - Option D is factually wrong (the text compares the *level of risk*, not the specific *respiratory damage*).
 - Option B perfectly paraphrases the sentence using different vocabulary: "sitting for long periods" (physical inactivity), "severe medical hazards" (profound consequences/medical risks), and "comparable to" (equate directly). Correct Answer: B

D. Independent Practice Task

Passage for Practice: Psychologists define *procrastination* not as a flaw in time management, but as a maladaptive mechanism for coping with challenging emotions. When faced with a task that triggers anxiety, boredom, or self-doubt, our brains prioritize short-term mood repair over long-term goals. We temporarily escape the negative emotion by diving into a comforting distraction.

Question: Which of the following options best restates the core message of the passage?

- A. Procrastination is a time-management failure caused by an individual's inability to organize their daily schedule.
- B. People procrastinate because their brains choose to avoid immediate negative feelings by seeking temporary distractions.
- C. Anxious individuals are completely incapable of completing long-term goals due to emotional instability.
- D. Diverting attention to comforting distractions is the most effective way to permanently cure task-related anxiety.
- E. Organizing tasks according to emotional difficulty is the best time-management framework available.
